UNOR Announces its 2010 Exploration Season

UNOR Inc. (TSX-V: UNI) announces for 2010 the company will be raising up to \$500,000 flow-through capital to cover the geological compilation of previous results and to diamond drill its Independence Cu-Mo-Au property and its four gold properties. Until there is an improvement in the uranium market, the company will maintain its Nunavut uranium properties on a care-and-maintenance basis.

Commenting, UNOR President & CEO George Bell said: “the company has an advanced portfolio of Canadian copper, gold and uranium properties which allows it in 2010 to work on its copper and gold properties while maintaining its uranium properties in good standing. This commodity mix is an attractive feature of the company.”

The company’s Independence property has four contiguous crown grants and is located 50 km south of Merrit, British Columbia and 5 km from a junction on the Coquihalla Highway. A number of previous operators have conducted geological mapping, geochemical and geophysical surveys, trenching and diamond drilling on the property. The historical diamond drilling was to a maximum depth of 400 ft (122 m) bottoming in mineralized rocks and for 2010, the company plans to drill two holes to depths exceeding 1,500 ft (450 m) based on the previous observations by consultants of stronger and better grade mineralization at depth.

The company’s four Timmins area gold properties covering 42 claims are on the Destor-Porcupine (DPFZ) and Pipestone (PF) faults. The 2010 exploration program would include detailed geological prospecting, mapping, sampling on all properties and diamond drilling of several shallow holes on the Stock and Wilkie properties as follows:

- The Ogden property of 6 claims is within the DPFZ adjoining Goldcorp’s Timmins West property. The best historical gold assays obtained from the trenches in the northeastern part of the property were 0.03 oz/t over 12 ft with a high of 0.07 oz/t over 3 ft.
- The Stock property of 20 claims is within the PF adjoining St. Andrew Goldfields’ Clavos property. The spectral induced polarization/resistivity survey conducted in 2007 delineated three anomalies that constitute drill targets.
- The Walker property of 4 claims is within the PF. Further induced polarization/resistivity survey in the south of the property would investigate the fault and associated mineralization.
- The Wilkie property of 12 claims is within the PF. Previous historical drilling reported Au values of 0.024 oz/t over 8.6 ft, 0.020 oz/t over 13.2 ft and 0.023 oz/t over 21.1 ft. The induced polarization/resistivity survey completed in 1997 defined several anomalies that constitute drill targets.

UNOR Inc. is a junior exploration company with a portfolio of Canadian copper, gold and uranium properties. See website www.unorinc.com for more information. UNOR’s shares trade on the TSX Venture Exchange: UNI and Over-The-Counter in the United States: UNOFF. Cameco Corporation holds 18.7% of issued shares.
